

**Middleware disk space utilization/R&A approach**: MW disk space utilization will be monitored and reported internally to further validate results from the SSF Demonstration, which indicated that MW disk space utilization is more than sufficient to handle the transaction volume in an SSF environment. This performance measure will be reported at amber or above.

**Standard/Goal**: There is no goal for this performance measure, however, we have set internal tolerance triggers of green, 0 to 60 percent for normal processing; amber, 60-80 percent (start moving files off the X:drive); red, 80 percent.

**Proponent**: DALO-SSF
